Planned headline benchmark: NOT PROVIDED

Dryad doi:10.5061/dryad.m0cfxpp8v - BMDM movies labelled M0/M1/M2 - is the only public dataset with ACTIVATION-STATE LABELS ON VIDEO.

It is an author prerequisite: every automated endpoint serves a proof-of-work interstitial, which the plan forbids bypassing, so it had to be fetched by hand. It was not provided for this run.

Consequences, none of them worked around:

- Part A has NO video benchmark with activation-state labels, so the frame-shuffle control E5 cannot be evaluated on a labelled video task and Part A's classification evidence rests on static BBBC054 morphology classes.
- The F3.4 forecasting evaluation runs on S-BIAD2196 only, not on Dryad.

- Part C 8.4 (the C3 projection) cannot be performed: it needs image-space M0/M1/M2 centroids with stimuli matched to the omics anchors. See results/v1/partC/c3_projection.json.
- The planned every-2-hour linear-probe collapse monitor of F2.2 used Dryad; collapse was instead monitored by embedding std and effective rank logged every 50 steps.
